

Scenario brief: AI-powered meeting scheduler

Module: Scale and Future-proof the AI Workflow

Background:

You work on the HR operations team at a mid-sized tech company with 400 employees. Scheduling 1:1s, performance reviews, onboarding sessions, and exit interviews has become a time-consuming pain point. Managers are spending too much time emailing back and forth to find a time that works.

To address this, you've built a simple **AI-powered automated meeting scheduler** using tools like Calendly, Slack, and ChatGPT.

How the automation works:

- A manager drops a short request in a Slack channel (e.g., "Need to schedule 1:1s with my team this week").
- An AI assistant reads the request, checks the manager's calendar, and suggests time slots.
- It messages each employee with available options and confirms the meeting automatically.
- Summaries are logged in Google Sheets for HR tracking.

Early results:

- Manager time spent scheduling meetings dropped from 90 minutes/week to 15 minutes/week.
- Missed or rescheduled meetings declined by 40%.
- Employees say the system "feels seamless" and reduces the back-and-forth.

Your task:

Create a 3–5 slide presentation using **Gamma** to pitch this automation to the company's leadership team. You'll aim to:

- Explain the problem and how the automation solves it.
- Highlight early results.
- Build emotional and strategic value.
- Make a compelling case for rolling it out company-wide
