AI-Powered Automated Workflows

AI Workflow practice:
Step-by-step build guide

Let's get shredded

INSTRUCTIONS: How to use this deck

This deck will walk you through how to build an AI-powered workflow step by step, no guessing, no code required.

What to expect:

You'll follow a structured format that guides you through:

- Setting up each tool
- Connecting systems like ChatGPT to give your automation a brain
- Testing and troubleshooting
- Practicing prompt design and automation logic

What you'll need:

- This deck
- Your no-code tool open (e.g., Make.com or n8n)
- Your tool accounts set up and logged in
- Any scenario-specific templates or assets

WORKFLOW OVERVIEW

- **Workflow name:** Let’s Get Shredded
- **What this workflow does:** This custom chatbot is your personal trainer. It replies with a knee-friendly, 30-minute at-home workout tailored to the day of the week. It knows you prefer mat-based routines, want to stay consistent, and don’t want to think too hard. The best part? You can tweak the prompt anytime as your goals evolve.
- **Problem it solves:** Most of us forget what we did last week or even yesterday. Traditional workout plans require memory, discipline, or checking back with a trainer’s notes. This bot removes all that friction. It delivers the right workout at the right time, keeps it safe for sensitive joints, and helps you build consistency without decision fatigue.
- **Objective:** You will build a context-aware automation that combines:
  - Triggering on user input
  - Variable setting and condition logic
  - OpenAI prompt engineering
  - Custom response delivery

This automation helps you recap the the fundamentals of event-driven flow, filtering, variable usage, and AI module integration.

- **Tools Required:** Make.com, Telegram, OpenAI (GPT-4o-mini)

PROCESS MAP

Here is the process map for the workflow you will build in **Make.com**. Remember, once you've visualized your process, you're set to build your automation.

LET'S GET SHREDDED

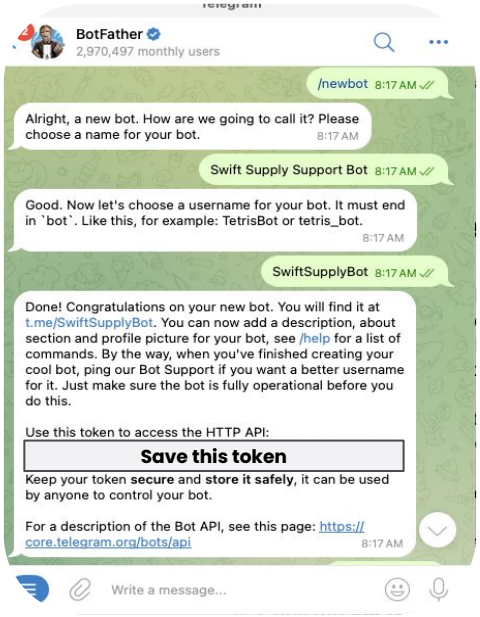
Get started with building your automation

Go to the next slide to get started with step-by-step instructions for building your automation

Let's Get Shredded

STEP 1: Set up Telegram Bot

1. **Create a Telegram Bot using BotFather**
   - Open Telegram and search for "BotFather" in the search bar.
   - **NOTE**: If you already have a bot setup while testing the workflows in this module, you can simply use the same one.
   - Or, start a chat with BotFather and send the command: /newbot
   - Follow the instructions to create your bot, including providing a name and username.
   - After completing the steps, BotFather will give you the **API Token** for your bot. Save this token, as you will need it to integrate the bot with Make.com.
2. **Obtain the Bot Token**
   - Save the **API Token** provided by BotFather.



Install Telegram: For Telegram setup steps, see this PDF document, Telegram setup. For full Telegram bot setup steps, see this PDF document, Telegram bot set up.

STEP 2: Integrate Telegram Bot into Make.com

1. **Log into Make.com**
   - Open Make.com and log in with your credentials (sign up for free if you haven't created one yet)
2. **Create a New Scenario**
   - Click on the **Create a new scenario** button from your Make.com dashboard
3. **Add Telegram to your scenario**
   - Click on **+**, select the **Telegram Bot** app from the list of available apps and choose **Watch Updates**
4. **Connect Telegram to Make.com**
   - Choose the **Telegram Bot** app and select **Add**
   - You will be prompted to enter your **API Token** from BotFather
   - Paste the **API Token** in the required field and click **Continue**

continued on the next slide

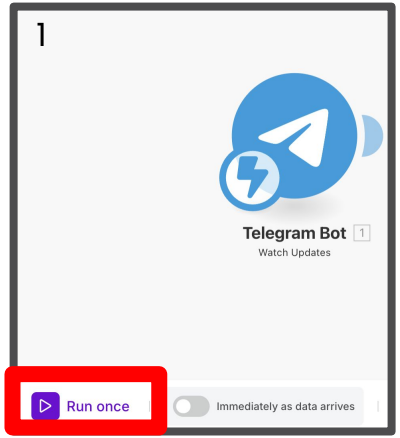
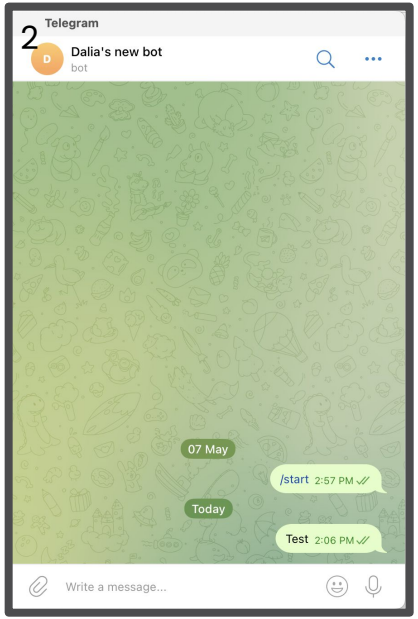
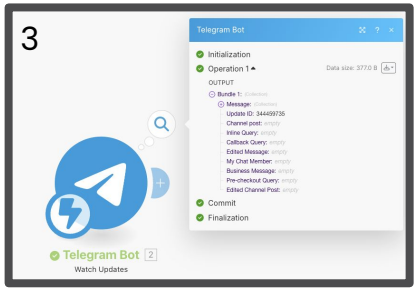
STEP 2: Integrate Telegram Bot into Make.com

5. Test the connection

- After connecting the bot, click on **Run once** to test the connection.
- Send a message to your Telegram bot from the Telegram app to ensure it receives updates.
- Click on the magnifying glass on the Telegram node to read the log to read the details about how the Node ran.







For more details on how to integrate Telegram with Make.com, refer to the [Make.com Telegram Guide.]

STEP 3: Set Variable – Get Day of the Week

1. Click on the **+** to add a new module.
2. Search for **Tools > Set Variable** and select it.
   - Input the **Variable Name**: day_of_the_week
   - For **Variable Value**: start typing formatDate(
     - You’ll see Make.com suggest the syntax.
     - Select **Message > date** from the Telegram module by clicking and dragging it in.
     - After the semicolon, type "d" - this tells Make to extract the numeric day of the week.

Why this matters:
Make.com doesn’t automatically know “what day it is.” You’re using this step to *teach* it how to pull that from the message timestamp and convert it to a number. That number (1–7) maps to a day so your workout makes sense.

3. Hit **Save** and check your input against the screenshot to make sure it looks right.

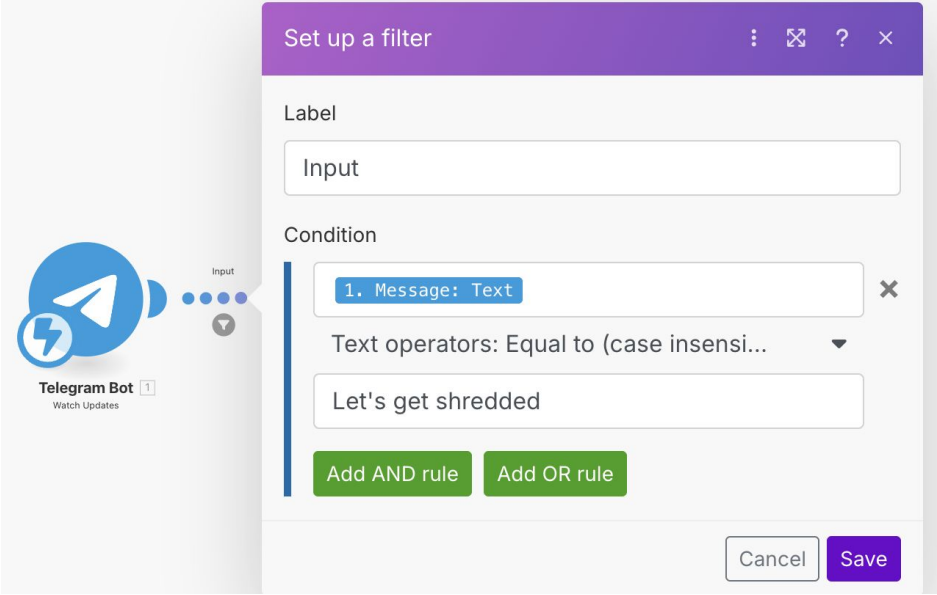
STEP 4: Filter – Only respond to "Let's get shredded"

Now let’s make sure your bot only reacts *when you want* it to.

1. Add a **filter** right after your trigger by clicking on the connecting link between the two modules.
2. Set two conditions - This way, it waits for *you* to give the signal.
   - Give a name/label: Input
   - Map the Telegram **Message › Text** by clicking and dragging equals Let’s get shredded (case-insensitive)
   - Feel free to add “add Or rule” and lets get shredded (no apostrophe) if you want to add another variation



Tip: Filters = control. You don’t want it responding to every “hi” or random emoji :-)

STEP 5: Generate your custom workout with OpenAI

1. **Connect OpenAI to Make.com**
   - In Make.com, click the **+** button to add a new module.
   - Search for **OpenAI** in the app search bar.
   - Select the **OpenAI** app, then click **Add.**
   - Sign in to your OpenAI account and authorize Make.com.
     to connect to your OpenAI account.
   - Use the API key you were given as part of this course. If you have not received this yet, please contact your Learner Success Advocate.
2. **Create a Chat Completion module**
   - After adding OpenAI, choose the **Create a Chat Completion** method.
   - Select your **Model** (Choose "GPT-4o-mini." The API for this course only works with the "GPT-4o-mini" model, other models will give an error.).
   - Under **Messages**, assign 2 roles and set up your prompt:
     - A friendly system message describing the weekly workout themes *(see notes in this slide for the prompts)*
     - A user message asking for a short, 30-minute, knee-friendly routine with 4–6 bullet points
     - Map **Tools > day_of_the_week** to pass the right day.
     - Hit **Save.**

STEP 6: Send the workout back to you in Telegram

Let’s now complete the loop and send the AI-generated workout right back to you on Telegram.

1. Click on the **+** to add **Telegram > Send a Reply Message**
2. Under **Connection**, select your Telegram bot connection (same one from the trigger step)

Now fill in the fields:

- **Chat ID:** Click into this field and drag in **Message > Chat > ID** from the Telegram trigger module
- **Text:** Drag in the **Result** from the OpenAI module – this is the actual workout it created

This sends the message right back into the same Telegram thread where you typed "Let's get shredded." No need for a new window or app. It is supposed to feel like chatting with your own smart trainer.

STEP 7: Run and test your workflow

- Don’t forget to **Save** your workflow and give it a name.
- Now that all of your nodes are connected and all your credentials have been inserted, run your workflow.
- Hit **Run Once** on Make.com.
- Once you’ve hit run, send a message through your Telegram bot to get your automation in motion.
- This message can be **Let’s get shredded**. You should see the output depending on the day of the week.
- **Tip:** Remember! At the time of testing, your Telegram input takes that specific day of the week and provides the output accordingly. Try the same workflow on a different day to see if it can customize for that appropriate day too!

STEP 8: Debug and troubleshoot your workflow

Did your automation run into errors? If so, be sure to double-check the following items:

- ❏ Make sure each module is connected to valid **credentials** (OpenAI, Telegram, etc.).
- ❏ Check that your **data-mapping** is correct - especially when dragging fields.
- ❏ Use real, testable **inputs** to simulate the flow (e.g., type "Let's get shredded" in Telegram to trigger it).

Use this cheat sheet to troubleshoot common issues:

Symptom	Likely cause	What to check
Telegram reply is blank	OpenAI module not outputting content	Check all mapped fields and prompts.
Telegram keeps loading, no message ever arrives	Telegram received input but workflow didn't continue	Check that your filter is correct and matches the exact text (case-insensitive), apostrophe, spelling etc.
Nothing triggers	Telegram "Watch Updates" not connected to the same Telegram bot "Send a Reply"	Double check the two Telegram bots to see if they are the same. Clear/delete all the old Telegram credentials and try to input your new credentials by clicking "Add".
AI reply sounds off-topic or empty	Prompt or variable not set right	Confirm day variable is mapped as {{8.day_of_the_week}}; tweak the prompt too.

REFLECT

Record your thoughts about this process including what you needed to do to obtain the desired results. Take notes in your study guide to help you document your thoughts along the way.

- What challenges did you face in building your workflow?
- How did the tool integration go?
- What troubleshooting steps did you have to take?
- What did you learn about building AI-powered automations?
